CISCO NETWORKING ACADEMY PROGRAM · IILM UNIVERSITY

AI & Data Analytics

Virtual Internship Showcase

From foundational AI concepts to a working AI-assisted network diagnostics dashboard — NetSage AI.

STUDENT

Academy

COMPLETED

11 June 2026

What this internship covered

1

Program Scope

Completed three Cisco Networking Academy courses delivered through IILM University, spanning foundational AI, applied AI, and data analytics.

2

Certification

All three courses completed and certified on 11 June 2026, instructed by Swati Vashisht, each with an independently verifiable certificate ID.

3

Capstone Build

Applied the coursework to a real engineering domain by designing NetSage AI — an AI-assisted network troubleshooting dashboard.

4

Outcome

Demonstrated the ability to connect AI concepts, applied data analysis, and full-stack development into one coherent, working product.

Cisco Networking Academy × IILM University

Cisco Networking Academy

A global Cisco skills-building program offering self-paced, industry-aligned courses in networking, AI, and data — used here as the certifying body for all three completed courses.

IILM University

Delivered the program to its students through the Networking Academy platform, providing structured access to the AI and data analytics course tracks.

Verified Completion

Each course concluded in a signed certificate — instructed by Swati Vashisht and dated 11 June 2026 — carrying a unique certificate ID for independent verification.

Three courses, one connected skill path

Introduction to Modern AI

AI, ML & Generative AI, demystified

How artificial intelligence, machine learning, and generative AI relate to one another and where each is actually used.

How modern models learn

A conceptual look at how today's AI systems — including large language models — are trained on data to recognize patterns and generate output.

AI across industries

Real-world examples of AI adoption across business, healthcare, and technology, framed around practical impact rather than hype.

Thinking responsibly about AI

An introduction to the ethical questions modern AI raises — bias, transparency, and the human role in overseeing AI decisions.

Apply AI: Analyze Customer Reviews

A hands-on applied-AI project

Working with a real, messy dataset of customer reviews rather than a theoretical exercise — the core focus of this course.

Extracting sentiment & themes

Using AI tools to classify sentiment and surface recurring themes hidden inside unstructured customer feedback.

Prompting AI for structured output

Practicing how to phrase prompts so an AI tool returns clean, structured insight instead of vague summaries.

From insight to business action

Translating AI-generated findings into recommendations a business team could actually act on.

Data Analytics Essentials

The data analysis lifecycle

Collecting, cleaning, analyzing, and visualizing data as a repeatable process rather than one-off spreadsheet work.

Working with structured datasets

Practicing core data-handling skills needed to make sense of tabular, real-world data.

Visualization & dashboards

Turning raw numbers into charts and summary views that communicate a finding at a glance.

Data-driven decision-making

Using evidence from data — not intuition alone — to justify a conclusion or recommendation.

CAPSTONE PROJECT

NetSage AI

AI-assisted network troubleshooting, with a human always in the loop

Putting the internship's AI and data-analytics learning into practice, NetSage AI is a network-diagnostics dashboard: it takes a fault symptom and device output, proposes an AI-generated root cause with a confidence level and fix steps, and logs every case for human review — turning an internship concept into a working, demo-ready product.

React 18

TypeScript

Vite

Tailwind CSS

Supabase

lucide-react

BUILT FOR

**Network engineers
triaging faults faster
with AI support**

COVERS

8 fault types across
OSI Layers 2, 3 & 7

KEY IDEA

*AI proposes.
A human decides.*

The dashboard, as built

Live screenshot of the NetSage AI dashboard — summary stat cards, fault-type & review-verdict charts, and the sortable case table.

Inside a case, and inside the oversight log

Case detail panel: AI root cause, evidence, next command & fix steps beside the human reviewer's verdict.

Responsible AI Log: every edited or rejected diagnosis, with what the AI got wrong and why.

What the dashboard actually does

Fault types the AI is trained to recognize

Example case: "Hosts on floor-2 cannot reach the floor-1 server segment but can reach the internet" → AI diagnosis: VLAN trunk misconfiguration on the core switch uplink — confidence: High — reviewer verdict: Accepted.

How a single fault case flows through the system

Responsible AI, built into the workflow

Nothing is auto-applied

Every AI diagnosis sits behind a human reviewer before it's treated as final — the AI proposes, it never executes.

Confidence is shown, not hidden

Each diagnosis carries a visible High / Medium / Low confidence rating, so reviewers know how much to trust it.

A dedicated Responsible AI Log

Every edited or rejected diagnosis is recorded with the reviewer's note, creating a transparent trail of where the AI was wrong.

Human-in-the-loop by design

The product's model is augmentation, not automation — AI accelerates triage while engineers stay accountable for the fix.

OUTCOME

Skills demonstrated across this internship

AI Literacy

Understands core AI/ML/GenAI concepts and where each applies

Applied AI & Prompting

Used AI tools to extract structured insight from real text data

Data Analytics

Comfortable across the collect → clean → analyze → visualize cycle

Frontend Engineering

Built a production-style dashboard in React, TypeScript & Tailwind

Network Fundamentals

Applied OSI-layer thinking to VLAN, DHCP, DNS, routing & ACL faults

Responsible AI Design

Designed a human-in-the-loop review flow instead of blind automation
